

V Traco

Updated Project Scope

Attendance, Payroll, Reimbursement, Projects, and Reporting

Document purpose: This file consolidates the existing V Traco scope and the newly requested features into one developer-ready reference. It expands the current attendance application into a multi-role workforce platform with payroll rules, reimbursements, project/session controls, and admin reporting.

1. Project Overview

V Traco is a PHP and MySQL-based attendance, payroll, and workforce management application. The revised scope keeps the current attendance foundation and adds role expansion, salary rules, session-based incentives, reimbursement workflows, project management, and a dedicated report module in the admin panel.

2. Roles and Access Control

The system will support the following roles:

- Admin
- Office Employee
- Session / Trainer Employee
- Independent Corporate Employee (Freelancer)
- Contractual Vendors Employee

Access rules:

- Admin can access all employees, payroll, projects, reimbursements, reports, and analytics.
- All non-admin users can access only their own dashboard, calendar, salary summary, reimbursement history, and personal analytics.
- Non-admin users cannot view other employees' records or organization-wide reports.

3. Authentication and Registration

- A single login form will be used for all roles.
- Users will be redirected after login based on their assigned role.
- Admin self-registration may remain available if required.
- Employee accounts should preferably be created by admin to avoid unverified staff registrations.
- If employee self-registration is enabled later, the account should stay inactive until admin approval.

4. Employee Management

Admin should be able to create and maintain employee profiles with the following fields:

- Full name and contact details
- Role type and employment category
- Monthly salary
- Incentive eligibility
- Monthly incentive amount

- Expected session count for incentive calculation
- Employee status: active or inactive
- Joining date and operational notes

5. Attendance and Calendar Enhancements

- Existing attendance features such as punch-in, punch-out, biometric options, leave, and monthly calendar will remain in place.
- Employee punch-out should include linked project/session selection instead of relying only on free-text entries.
- Day type should support Full Day and Half Day selection where relevant.
- Employees should continue to see only their own attendance and salary preview data.

6. Project / Session Management

A dedicated Projects tab will be added in the Admin Panel. In this scope, a project represents a college session or training engagement.

- Admin can create, edit, activate, deactivate, and maintain project/session records.
- Project fields should include session title, number of days, college name, location, start date, end date, and active/inactive status.
- Only active projects should appear in employee punch-in or punch-out forms.
- Project/session mapping should be available for attendance history, reporting, and incentive calculation.

7. Payroll and Incentive Management

The payroll module should be expanded from a simple salary preview into a rule-driven salary and incentive workflow.

- Admin can define monthly salary for office employees and session/trainer employees.
- Admin can define a monthly incentive amount for eligible employees.
- Admin can define expected session count for the month.
- The system should calculate earned incentive from full sessions and half-day sessions.

7.1 Incentive Eligibility Rules

- Session / Trainer Employees may be eligible for incentive.
- Office Employees are not eligible for incentive.
- Any employee with monthly salary below Rs 8,000 is not eligible for incentive.
- Freelancer and contractual vendor incentive rules can remain disabled unless the business decides to include them later.

7.2 Calculation Logic

- Full session incentive = Monthly incentive pool / expected full sessions.
- Half day incentive = Full session incentive / 2.

Example: If an employee has a monthly salary of Rs 10,000, a monthly incentive pool of Rs 3,000, and an expected 20 full sessions, then the full session incentive will be Rs 150 and the half day incentive will be Rs 75.

8. Reimbursement Module

- A reimbursement button should be displayed above the calendar for all employee roles.
- When clicked, the employee should see a form with amount, title or purpose, date, remarks, and proof upload.
- Allowed proof formats should include JPG, PNG, and PDF.
- Submitted reimbursement requests should appear in the admin panel.
- Admin should be able to review, approve, reject, and mark requests as paid.

8.1 Reimbursement Status Flow

- Pending
- Approved
- Rejected
- Paid

9. Reports Module

A new Reports tab will be added in the Admin Panel.

- Attendance reports: monthly attendance, date-wise summaries, and present/absent/half day/leave counts.
- Salary reports: base salary, incentive amount, earned incentive, reimbursement totals, and final payable.
- Reimbursement reports: pending, approved, rejected, and paid requests with employee and month filters.
- Project/session reports: project-wise attendance, employees linked to each session, activity status, and college-wise breakdown.
- Employee analytics: individual performance summary, session counts, half days, salary summary, and reimbursement history.
- Exports: CSV and Excel export options for admin reports.

Access rule for reports: Admin can access all reports and organization-wide analytics. Non-admin users can access only their own summary and analytics.

10. Recommended Database Enhancements

- Update users table with role type, monthly salary, incentive amount, incentive eligibility, expected sessions, and account status.
- Add a projects table for college/session master data.
- Add a reimbursements table with amount, purpose, proof file, status, remarks, and timestamps.
- Add an optional monthly payroll table to store finalized month-wise salary outputs.

11. Security and Validation Requirements

- CSRF protection on all forms.
- Role-based authorization checks on every protected route.
- Strict file upload validation for reimbursement proofs and punch uploads.
- Secure password reset workflow.
- Environment-based config for mail and sensitive settings.

- Action logging for salary edits, approvals, imports, and deletions.

12. Suggested Delivery Phases

- Phase 1: Role model update, login flow changes, and employee access control.
- Phase 2: Salary fields, incentive eligibility rules, and payroll calculation update.
- Phase 3: Reimbursement module, proof upload, and admin approval/payment tracking.
- Phase 4: Project/session management and punch mapping.
- Phase 5: Reports, filters, exports, and admin analytics.

13. Final Positioning

With these updates, V Traco becomes a multi-role attendance, payroll, reimbursement, project, and reporting system. The revised scope keeps the working attendance foundation while adding the operational features needed for broader internal use.
